DETAILED ACTION

Drawings

1. The drawings are objected to under 37 CFR 1.83(a). The drawings must show every feature of the invention specified in the claims, as well as any structural detail that is essential for a proper understanding of the disclosed invention. Therefore, the outlet line for the heat transfer medium 'ending flush with an interior wall of the lid enclosing the hollow space', as well as the feed vessels related to the reactors and the through lines, must be clearly shown or the feature(s) canceled from the claim(s). No new matter should be entered.

Corrected drawing sheets in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. Any amended replacement drawing sheet should include all of the figures appearing on the immediate prior version of the sheet, even if only one figure is being amended. The figure or figure number of an amended drawing should not be labeled as "amended." If a drawing figure is to be canceled, the appropriate figure must be removed from the replacement sheet, and where necessary, the remaining figures must be renumbered and appropriate changes made to the brief description of the several views of the drawings for consistency. Additional replacement sheets may be necessary to show the renumbering of the remaining figures. Each drawing sheet submitted after the filing date of an application must be labeled in the top margin as either "Replacement Sheet" or "New

Sheet” pursuant to 37 CFR 1.121(d). If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

Claim Rejections - 35 USC § 112

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

3. Claims 6-11 are rejected under 35 U.S.C. 112, second paragraph, as being unclear for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention

Claim 6 recites the intended use of the metering devices, feed vessels, inlet / outlet lines and through lines, but does not set forth any structural inter-relationships between these elements.

Claim 9 recites the outlet line for the heat transfer medium ‘ending *flush* with an interior wall of the lid enclosing the hollow space’. In light of the two common meanings of the term ‘flush’ (‘even or level, as with a surface; forming the same plane’, and ‘having direct contact; being right next to; immediately adjacent; contiguous’), it is not clear what structure is actually meant. For examination purposes, the second connotation is assumed.

Claim Rejections - 35 USC § 102

4. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

5. Claims 6-11 are rejected under 35 U.S.C. 102(b) as anticipated by Brautigam (US 4,263,260).

Brautigam discloses a reactor comprising a cylindrical body 1 (see Figure 2A), through ducts 11, 12 for feeding hot reaction gas and discharging cold reaction gas, correspondingly ; and tubes 9, 10 for feeding / discharging a heat transfer medium [‘inlet ‘outlet lines’]. Cover 2 and stiffening plate 23a welded at 23a' to the ducts 12, 12' from a head [‘hollow space lid’ / ‘flat disk’] having an ‘increased cross-section at its upper side and underside’. Fitting 11a (see Figure 1) can be flanged to a source of the hot reaction gas [‘feed vessel’]. The apparatus also includes valves [‘metering and feed devices’] communicating with the various lines in the head or at the cover of the heat exchanger for controlling the fluid flow (Col.5, lines 24-25).

Regarding claims 9-10, the tubes 9, 10 project into a hollow space of the lid and end right next to [‘flush’] to wall 2 enclosing the hollow space. The through ducts 11, 12 project into the interior space of reactor (Figure 2A).
